

surrounding rock stress.

The field measured indices (e.g. deformation and stress) were subjected to comprehensive comparison. The results show that the reservation of a large space has a better stress performance than the pilot heading method. From our analysis, it can be seen that the space reservation method is more suitable for pre-excavation release of the geo-stress in high geo-stress soft rock tunnel.

## ACKNOWLEDGMENT

The project was Supported by Gansu Provincial Science and Technology Program (18YF1GA055)
